Complex & Adaptive Systems Laboratory

**Dr. Miguel Nicolau**

*Artificial Intelligence in Games  
Using Evolutionary Techniques*

*COMP30290 Natural Computing*

*COMP41190 Natural Computing and Applications*

## Outline

- 1 **Evolutionary Algorithms and Games**
- 2 **Move Optimisation with Toribash**
- 3 **Path Planning with Ms. Pac-man**
- 4 **Reactive Behaviour with Super Mario Bros**
- 5 **Observations**

## Evolutionary Algorithms and Games

### What are EAs?

- ▶ Population-based algorithms;
- ▶ Darwinian theory of evolution: survival of the fittest;
- ▶ Stochastic;
- ▶ Genetic operators drive evolution:
  - ▶ Selection;
  - ▶ Recombination;
  - ▶ Mutation;
  - ▶ Replacement.
- ▶ Three main decisions: **algorithm, representation, evaluation.**

# Evolutionary Algorithms and Games

## Why games?

- ▶ Billion-euro industry;
- ▶ Public exposure;
- ▶ Excellent research testbeds (path planning, move optimisation, dynamic responsiveness);
- ▶ Challenging (human-like behaviour, repetitiveness, opponent level).

## Why EAs?

- ▶ Powerful search algorithms (human competitive);
- ▶ Often find non-obvious solutions;
- ▶ Adaptability and usability.

## Move Optimisation with Toribash

### Game Description

- ▶ Avatar fight game, turn-based;
- ▶ At each turn, player controls joint angles of avatar;
- ▶ Objective: defeat opponent.

## Move Optimisation with Toribash

### Facts

- ▶ Ragdoll physics;
- ▶ Freeware;
- ▶ Active online community.

### Why Toribash?

- ▶ Create adaptive behaviour;
- ▶ Reactive planning to opponent's actions;
- ▶ No predefined moves;
- ▶ Non-deterministic outcome.

## Move Optimisation with Toribash

### Algorithm

- ▶ Genetic Algorithm.

### Representation

- ▶ Each individual encodes choice for 22 joints, for each move:
  - ▶ Contract, extend, hold or relax;
  - ▶ 4.4 trillion possible combinations per move.

### Evaluation

- ▶ Evolve avatar against static opponent (1 or 3 moves);
- ▶ Fitness = Tori score - Uke score;
- ▶ Disqualification gets fitness 0.

## Move Optimisation with Toribash

Demo videos

## Path Planning with Ms. Pac-man

### Game Description

- ▶ Puzzle game, human vs. computer;
- ▶ Navigate tunnels, eat pills, avoid ghosts (power pills: eat ghosts!);
- ▶ Objective: eat all pills in each level.

## Path Planning with Ms. Pac-man

### Facts

- ▶ One of the most popular video games of all times;
- ▶ Originally introduced in early 1980s;
- ▶ 255 levels of increasing difficulty.

### Why Ms. Pac-man?

- ▶ Path planning in a dynamic environment;
- ▶ Non-deterministic behaviour for ghosts;
- ▶ Human players still far better;
- ▶ Used as benchmark in AI competitions.

## Path Planning with Ms. Pac-man

### Algorithm

- ▶ Grammatical Evolution.

### Representation

- ▶ Individual encodes choices of productions in a grammar:
  - ▶ Grammar provides syntactically correct solution;
  - ▶ Sequence of *if condition then action* rules with high-level functions;
  - ▶ *if (inedibleGhostDistance > safeDistance) then goto(nearestPill)*.

### Evaluation

- ▶ Face evolved controller against random or legacy team;
- ▶ Use available emulator;
- ▶ Fitness = game score (pills + bonuses).

## Path Planning with Ms. Pac-man

Demo videos

## Reactive Behaviour with Super Mario Bros

### Game Description

- ▶ Platform game, human vs. computer;
- ▶ Navigate through obstacles and enemies;
- ▶ Objective: reach end of each level, collect extra bonuses.

## Reactive Behaviour with Super Mario Bros

### Facts

- ▶ Best-selling video game series of all times;
- ▶ Originally introduced in 1983;
- ▶ Hundreds of levels in mushroom world.

### Why Super Mario Bros?

- ▶ Challenging mix of path planning vs. reactive behaviour;
- ▶ Popular benchmark in AI competitions;
- ▶ Compare different AI approaches.

# Reactive Behaviour with Super Mario Bros

## Algorithm

- ▶ Grammatical Evolution.

## Representation

- ▶ Individual encodes choices of productions in a grammar:
  - ▶ Grammar encodes behaviour trees;
  - ▶ High-level conditions: *EnemyAhead*, *GapBehind*;
  - ▶ High and low level actions: *UseRightGap*, *jump*, *shoot*.

## Evaluation

- ▶ Train controller on series of random maps;
- ▶ Validate on unseen maps (adaptability);
- ▶ Fitness = game score (distance + bonuses).

## Reactive Behaviour with Super Mario Bros

Demo videos

## Observations

### EAs and Games

- ▶ Adaptability of evolutionary techniques;
- ▶ High-level behaviours easier to understand and modify.

### Awards

- ▶ Mario entry finished 4<sup>th</sup> in CIG-2010 international competition.

### Possible extensions

- ▶ Toribash: face against reactive opponent;
- ▶ Ms. Pacman: add more refined behaviours;
- ▶ Mario: combine path planning (hard AI) with reactive behaviours.

## Next Classes

- ▶ Discussion group (Thursday);
  - ▶ Example conference paper with Mike.
- ▶ Project feedback after lectures.
